

webMethods™ QuickScan

One-week audit of your webMethods environment with clear scope and cost.

Situation

Enterprise Application Integration - or EAI - infrastructure has been around for some years now. CIO's recognise the long-term benefits, many companies have implemented some flavour of an EAI - environment.

webMethods™ (owned by Software AG™) offers a range of popular products for addressing EAI.

The Challenge

Introduction of an EAI environment is a complex operation which can easily give rise to a number of issues. Although such issues are not exceptional, it is not always clear why those issues are spawning; moreover it can also be unclear whether they are 'within reasonable limits' or not.

As a consequence, issues are often tackled in a fire-fighting fashion.

In such case, a more in-depth analysis is recommended. Although high-end EAI platforms - such as webMethods - are capable of dealing with a variety of technical challenges, a proper set-up and configuration is absolutely necessary. Bad design, a suboptimal

architecture, flaws in the implementation, or bad hardware dimensioning are just a few examples of causes that might seriously challenge the ROI of the investments in EAI.

A clear classification of the issues is desirable, as well as understanding the possible workarounds and/or alternatives.

Apogado's Approach

A team of highly specialised consultants performs a QuickScan of the hardware architecture, software architecture, database configuration, and software implementation.

The result of this QuickScan is a report, giving the **findings** per topic, a validation and **recommendations**, and a number of **action points**.

The report is then presented at your premises.

All this is typically done within a time-frame of one week.

"Apogado's team could immediately identify some critical points of attention in our environment. Their recommendations helped us to reassess our priorities"

Jan Verheyden, Sr. Manager Business Applications EMEA & APAC, Donaldson

Through our many years of experience in this matter and good knowledge of vendors/products available on the market, we are able to carry out this audit in a very cost-effective manner.

In a Nutshell

- ✓ Audit of your webMethods environment
- ✓ One week
- ✓ Clear and limited cost
- ✓ Clear report with findings, recommendations, and action points
- ✓ Presented at your premises

About Apogado

Apogado is a vendor-independent consultancy company focusing on integration, covering Enterprise Application Integration (EAI), Service Oriented Architectures (SOA), and B2B-integration. Apogado consultants are experienced in various aspects of integrating applications within one organisation, or between business partners. They are well trained and certified in various middleware products such as webMethods.

Within this niche Apogado can cover the whole track: guidance in the RFI/RFPP processes, studies, strategic roadmaps, functional or technical audits, architecture, design, implementation and project management.
